## HEAVY DUTY INDEPENDENT STYLE DISC SEALER

Our independent style disc sealer covers better, lasts longer and is more trouble free than any other on the market today. The independent arm design and the large 18" notched blades provides better knife track coverage and keeps the trash flowing thru without build-up or plugging, it also provides better coverage in uneven terrain and allows you to be more productive.

The large 18" notched blades have a small concave which allows you to run the blade straighter reducing wear and tear on bearings and spindles, minimizing disc trac. The variable blade pitch adjustment and three-hole design gives you the ability to adjust to your field conditions.

The heavy duty design based on tapered roller bearings instead of plastic, fiber or bronze bushings, heavier overall components, and elimination of springs other brands require for down pressure, increases trouble free life of our disc sealers.

Universal mounting allows you to mount to virtually any typical shank. Multiple slotted holes fit all common shanks: 1" x 2" flat, 1-1/4" square & 1-1/4" x 2" edge bent.
